Having a complete, timely and accurate ground surveillance picture is crucial for assuring the peace throughout the world.

To face the threats of the 21st Century, NATO forces will now have a system that provides them with a complete picture of the situation on the ground with wide-area, all-weather, 24 hour surveillance — the NATO owned and operated Alliance Ground Surveillance (NATO AGS) system.

Industry on both sides of the Atlantic is working together to provide NATO with an AGS capability that will support the full range of military and civil-military missions, that will provide security and protect lives.

The NATO AGS system will be a major contribution to NATO’s Joint Intelligence, Surveillance & Reconnaissance (JISR) capability and a key building block for NATO Network Enabled Capability (NNEC) operations.

It will also ensure interoperability with national and NATO assets as well as with EU Battle-Groups.

Thus, the Alliance and Europe are getting more than just airborne ground surveillance. They are getting eyes in the sky that will ensure our collective security.
